>Subject: Bay Delta
>
>Folks,
>
>It is essential that more fresh water flow through the delta into the bay to
>restore habitat for species unique to the fresh water/ocean water mix area.
>These species are integral to the bay delta environment. I am therefore
>imploing you that CALFED Bay Delta Program support and implement much more
>aggressive water conservation practices before deciding to undertake more
>dam and reservoir construction. The latter are expensive and
>environmentally deleterious alternatives to conservation.
>
>As agriculture uses over 80% of the state water supply, even a small
>reduction in the amount lost to evaporation can result in a significant
>water savings.
>
>Please invest in more efficient technology for reducing evaporation and
>water demand per acre of (agricultural) land. I am confident that these and
>similar measures can wring enough additional water out of the system without
>resorting to dam and reservoir construction.
>
>Sincerely,
>Michael Weinzwieg
